Myah OS 3.0 Box is now available. This is a complete Linux solution built around the Light X11 Desktop Environment. The LXDE desktop is designed to be the smallest, fastest and yet fully functional desktop for *Nix systems.

It's important to note that Box is not meant to be a light system. Instead it's meant to be a fully functional system built around a light desktop. There are many extremely light Linux systems out there already like DSL and Slax. Myah OS 3.0 Box is for people who want a full blown system built around a light desktop.

Box comes with much of the same software that was found in Mouse Pro. It has all the same multimedia support. You will be able to create 3D modules with blender, create graphics with inkscape or what ever else that may interest you.

Thanks to all those who tried Mouse Pro and made use of the forum. There were issues found in the auto detection of the sound and video. Both have been resolved. There was also a lot of request for better wifi support and Box has that as well. So thanks to all those who took the time to use the forum. It has been used to make Myah OS even better.

Thanks again.
